### Linking Your Telephone:

Use the same secure and controlled path to handle telephone calls and internet traffic to maximize your business resources. T-1 circuits can be custom designed to specifically meet the needs of your company. Think of a T-1 (1.5Mbps of dedicated bandwidth) as 24 channels with 64KB per channel. A client could split a T-1 into 12 voice lines and 768KB for internet traffic.

- Easily increase or reduce services based on the performance of your business.
- Define parameters for allocating more voice channels when needed to limit the possibility of missing a call.
- Control the safety of your telephone and internet networks with one security system.

### Internet Access:

#### Integrated Voice and Data Packages
